Abstract
The recent availability of safe volumizing fillers has provided cosmetic physicians
with the tools necessary to contour facial features non-surgically with negligible
downtime. This presentation focuses on outlining objective
parameters necessary for creating a template to maximize each individual's facial
beauty. The mathematical Golden Ratio Phi defines facial harmony and
proportion, and can be found over the entire beautiful face, regardless of race or
ethnicity. The Phi ratio defines the beautiful brow and ideally proportioned lips.
Using specially designed calipers that calculate Phi proportions, individual facial
beauty can be optimized naturally and consistently, non-surgically releasing
every patient's beauty potential. The technique has proven to be
reliable, reproducible, minimally invasive, result-oriented, synergistic, and
involves minimal anxiety and pain.
